Declaration

I, Aashish Semwal, hereby solemnly declare that the project report titled "**Privileged Access Management (PAM) System using Azure PIM**" submitted in partial fulfillment of the requirements for the award of the degree of **Master of Computer Application (MCA)** is my original work.

I further declare that:

- This project has been carried out by me during the academic year 2026 under the supervision of **Mr. Hari Krishna (Guide/Mentor Name)**.
- The work has not been submitted previously to any other university, institution, or examination body for the award of any degree, diploma, or certification.
- All sources of information used in this report have been duly acknowledged and referenced in accordance with academic ethics and plagiarism norms.
- The data presented in this report is authentic to the best of my knowledge and has not been fabricated or manipulated.
- I understand that if any part of this declaration is found to be false, my project may be rejected and disciplinary action may be taken as per institutional rules.

Place: Delhi

Date: 03 May 2026

Student Signature: Aashish Semwal

Student Name: Aashish Semwal

Enrollment No: O24MCA111642

Acknowledgement

I would like to express my heartfelt gratitude to my mentor for their invaluable guidance and encouragement throughout the development of my project on Privileged Access Management (PAM) System using Azure PIM. I am equally thankful to the faculty members for their constant support, insightful feedback, and for fostering an environment of learning and innovation.

Lastly, I sincerely appreciate the organization for providing me with the resources, opportunities, and platform to successfully carry out this project. Their collective support has been instrumental in shaping my learning journey and achieving this milestone.

This achievement would not have been possible without the collective support, encouragement, and inspiration of my mentor, faculty members, and the organization. I am truly grateful for their contributions, which have played a pivotal role in shaping both the project and my personal growth.

Abstract / Executive Summary (150–250 words)

- **Topic of the study:** This project focuses on implementing a Privileged Access Management (PAM) solution using Azure PIM.
- **Objective:** It aims to enhance security by controlling privileged accounts, enabling MFA, RBAC, and audit logging.
- **System Analysis:** Organizations face challenges in managing privileged accounts due to lack of visibility and control. The system reduces risks such as misuse, data breaches, and unauthorized access.
- **System Design:** As I'm using the Azure PIM solution which is cloud based service provided by Microsoft in which Flow of work be like:
User → MFA → RBAC → System Access → Logs → Vault
- **System Implementation:** The proposed Privileged Access Management (PAM) system is implemented using Azure Privileged Identity Management, which is a cloud-based solution provided under Microsoft Entra ID. This implementation demonstrates real-world management of privileged accounts with enhanced security features.
- **Testing:** It ensures that all functionalities of the system work correctly and securely. The system is tested to verify authentication, access control, monitoring, and security features
- **Future Scope:** In the future, the PAM system can be enhanced by integrating advanced automation and cloud-based solutions. For example, automated user provisioning can be implemented, where new users are automatically assigned roles and access based on their job profiles.

Abstract

Privileged Access Management (PAM) is an important part of cybersecurity today. It helps organizations protect their most sensitive systems and data by controlling who can use special accounts with high-level permissions. These accounts, often called *privileged accounts*, can make big changes in a system. If they are misused or hacked, they can cause serious damage. This project report focuses on building and testing a PAM solution using **Azure Privileged Identity Management (PIM)**.

The main goal of this project is to show how PAM can reduce risks, stop insider threats, and help organizations follow security rules and standards. The system was set up by creating roles in Azure Active Directory, giving access only when needed (called *just-in-time access*), and adding extra security steps like multi-factor authentication. Approval workflows were also added so that certain actions require permission before they can be done.

Monitoring and alerts were included to keep track of who is using privileged accounts and to quickly spot unusual activity. This makes the system safer and more transparent.

The results of the project show that Azure PIM is a strong tool for managing privileged accounts. It reduces the chances of attacks, improves accountability, and supports compliance with standards such as ISO and GDPR. Overall, this project highlights how PAM solutions can help organizations protect their digital assets and stay secure in today's fast-changing cyber world.

Chapter 1: Introduction

1. Background of Cybersecurity and Access Control

In today's digital era, organizations rely heavily on information systems to store, process, and manage sensitive data. With the increasing sophistication of cyber attacks, protecting these systems has become a top priority. One of the most critical aspects of cybersecurity is access control, which ensures that only authorized individuals can access specific resources. Traditional access control models often fail to address the risks posed by privileged accounts—those with elevated permissions that can make significant changes to systems.

2. Importance of Privileged Access Management (PAM)

Privileged accounts are essential for system administration, but they also represent a major security risk if misused or compromised. Attackers often target these accounts to gain control over critical infrastructure. PAM solutions are designed to minimize these risks by:

- Restricting permanent administrative access.
- Enforcing just-in-time (JIT) access.
- Monitoring and auditing privileged activities.
- Ensuring compliance with industry standards such as ISO, GDPR, and NIST.
- By implementing PAM, organizations can reduce insider threats, prevent unauthorized access, and strengthen their overall security posture.

3. Introduction to Azure Privileged Identity Management (PIM)

Microsoft's Azure PIM is a cloud-based solution that provides advanced capabilities for managing privileged accounts in Azure Active Directory (Azure AD). It allows organizations to:

- Assign roles dynamically.
- Require approval workflows for role activation.

- Enforce multi-factor authentication (MFA).
- Monitor and log all privileged activities.
- Configure alerts for suspicious behavior.
- Azure PIM integrates seamlessly with Azure AD, making it a scalable and flexible solution for enterprises adopting cloud technologies.

4. Objectives of the Project

The primary objectives of this project are:

- To design and implement a PAM solution using Azure PIM.
- To demonstrate how JIT access and approval workflows enhance security.
- To evaluate the effectiveness of Azure PIM in reducing risks associated with privileged accounts.
- To highlight compliance benefits and operational efficiency gained through PAM.

5. Scope of the Project

This project focuses on the implementation of Azure PIM within a controlled environment. It covers:

- Configuration of privileged roles.
- Activation and deactivation of roles using JIT access.
- Enforcement of MFA for role activation.
- Monitoring and auditing privileged activities.
- Testing scenarios to validate security improvements.

6. Significance of the Study

The study demonstrates how organizations can leverage Azure PIM to strengthen identity governance and protect digital assets. It provides practical insights into deploying PAM

solutions in real-world environments, making it valuable for IT administrators, security professionals, and organizations transitioning to cloud infrastructure.

7. Structure of the Report

The report is organized into the following sections:

- Abstract and Introduction.
- Literature Review on PAM and related tools.
- System Design and Implementation using Azure PIM.
- Evaluation and Results.
- Conclusion and Future Scope.

For Microsoft Entra roles in Privileged Identity Management, only a user who is in the Privileged Role Administrator or Global Administrator role can manage assignments for other administrators. Global Administrators, Security Administrators, Global Readers, and Security Readers can also view assignments to Microsoft Entra roles in Privileged Identity Management.

For Azure resource roles in Privileged Identity Management, only a subscription administrator, a resource Owner, or a resource User Access Administrator can manage assignments for other administrators. Users who are Privileged Role Administrators, Security Administrators, or Security Readers don't by default have access to view assignments to Azure resource roles in Privileged Identity Management.

Terminology

Term or concept	Role assignment category	Description
eligible	Type	A role assignment that requires a user to perform one or more actions to use the role. Once an administrator makes a user eligible for a role, the user can activate the role when they need to perform privileged tasks. There's no difference in the access given to someone with a permanent role assignment versus someone with an eligible role assignment. The only difference is that the persons with an eligible role assignment don't need that access all the time.
active	Type	A role assignment that doesn't require a user to perform any action to use the role. Users assigned as active have the privileges assigned to the role.
activate		The process of performing one or more actions to use a role that a user is eligible for. Actions might include performing a multifactor authentication (MFA) check, providing a business justification, or requesting approval from designated approvers.
assigned	State	A user that has an active role assignment.
activated	State	A user that has an eligible role assignment, performed the actions to activate the role, and is now active. Once activated, the user can use the role for a preconfigured period of time before they need to activate again.
permanent eligible	Duration	A role assignment where a user is always eligible to activate the role.
permanent active	Duration	A role assignment where a user can always use the role without performing any actions.
time-bound eligible	Duration	A role assignment where a user is eligible to activate the role only within start and end dates.
time-bound active	Duration	A role assignment where a user can use the role only within start and end dates.
just-in-time (JIT) access		A model in which users receive temporary permissions to perform privileged tasks. This design prevents malicious or unauthorized users from gaining access after permissions expire. An organization only grants access when users need it.

principle of least privilege access	A recommended security practice in which an organization provides every user with just the minimum privileges needed to accomplish their authorized tasks. This practice minimizes the number of Global Administrators. Instead, it uses specific administrator roles for certain scenarios.
-------------------------------------	--

You should review the following terms to better understand Privileged Identity Management.

Type of assignments

There are two types of assignment – eligible and active. Users who are eligible for a role can activate the role when they need to perform privileged tasks.

You can also set a start and end time for each type of assignment. This addition gives you four possible types of assignments:

- Permanent eligible
- Permanent active
- Time-bound eligible, with specified start and end dates for assignment
- Time-bound active, with specified start and end dates for assignment
- In case the role expires, you can extend or renew these assignments.

Microsoft recommends you keep zero permanently active assignments for roles other than the recommended two break-glass emergency access accounts, which should have the permanent Global Administrator role.

Additional reading: For more information, see the following resources:

- License requirements to use Privileged Identity Management.
- Built-in roles for Azure resources.
- Assign Microsoft Entra roles in Privileged Identity Management.
- Activate my Microsoft Entra roles in PIM.

Chapter 2: System Study

(MCA/MSc(DS) min 8 pages | BCA min 5 pages)

Microsoft Entra ID automatically assigns the Microsoft 365 Security Administrator role and the Privileged Role Administrator role to the first person to use Privileged Identity Management (PIM) in an organization's instance of Microsoft Entra ID. This person must be an eligible Microsoft Entra user. Only Privileged Role Administrators can manage the Microsoft Entra directory role assignments of users.

PIM role assignments give organizations a secure way to grant access to their resources. The PIM role assignment process includes the following tasks, each of which this unit examines in greater detail:

- Configure PIM role settings.
- Assign roles to users.
- Activate role assignments.
- Approve or deny requests.
- Extend and renew assignments.

Privileged Identity Management lets you know when important role-related events occur in your Microsoft Entra organization. For example, when an administrator assigns or activates a role. PIM keeps you informed by sending you and other participants email notifications. These emails might also include links to relevant tasks, such as activating or renewing a role.

Configure PIM role settings

In Privileged Identity Management, role settings define role assignment properties, such as:

- Multifactor authentication (MFA) and approval requirements for activation
- Assignment maximum duration
- Notification settings

You must have either the Global Administrator or Privileged Role Administrator role to manage PIM role settings for a Microsoft Entra role. You define role settings per role. In other words, all assignments for the same role follow the same role settings. Role settings of one role are independent from role settings of another role.

Organizations should complete the following tasks to configure PIM role settings.

Task 1 - Discover and mitigate privileged roles

You should identify who has privileged roles in your organization. As part of this process, you should:

- Review the users assigned.
- Identify administrators who no longer need the role.
- Remove them from their assignments.
- You can use Microsoft Entra roles access reviews to automate the discovery, review, and approval or removal of assignments.

Task 2 - Determine the roles that you want PIM to manage

After you discover and mitigate privileged roles, you should then prioritize the protection of Microsoft Entra roles that have the most permissions. You should also consider what data and permissions are most sensitive for your organization.

First, you should ensure that PIM manages all Global and Security Administrator roles. Why? Because the users assigned to these roles can do the most harm when compromised. Then consider other roles used throughout your organization that are potentially vulnerable to attack. You should ensure that PIM also manages these roles.

Task 3 - Configure PIM settings for Microsoft Entra roles

Finally, you should draft and configure your PIM settings for every privileged Microsoft Entra role that your organization uses.

The following graphic provides an example of how an organization can plan their role settings.

Role	Require MFA	Notification	Incident ticket	Require approval	Approver	Activation duration	Perm admin
Global Administrator	✓	✓	✓	✓	Other Global Administrator	1 Hour	Emergency access accounts
Exchange Admin	✓	✓	✗	✗	None	2 Hour	None
Helpdesk Admin	✗	✗	✓	✗	None	8 Hour	None

You can configure the following PIM role settings:

Activation maximum duration. Use the Activation maximum duration slider to set the maximum time, in hours, that an activation request for a role assignment remains active before it expires. This value can be from one to 24 hours. If you enter a value greater than 24 hours, the system reverts it back to 24.

On activation, require multifactor authentication. Before a user who is eligible for a role can activate the role, you can require they prove their identity using Microsoft Entra multifactor authentication (MFA). MFA ensures the user is who they say they are with reasonable certainty. Enforcing this option protects critical resources in situations involving a potentially compromised user. The system doesn't prompt users for multifactor authentication if they authenticated with a strong credential or provided multifactor authentication earlier in their session.

Microsoft recommends that organizations require MFA for all their administrators. Multifactor authentication reduces the risk of an attack using a compromised password. You can require that users complete a multifactor authentication challenge when they sign in. You can also require that users complete a multifactor authentication challenge when they activate a role in PIM. This way, even if the user didn't complete multifactor authentication when they signed in, PIM asks them to do it.

Require justification on activation. You can require users to enter a business justification when they activate the eligible assignment.

Require ticket information on activation. You can require users to enter a support ticket number when they activate the eligible assignment. This setting is an information-only field. PIM doesn't enforce correlation with information from any ticketing system.

Require approval to activate. You can require approval for activation of eligible assignment. The approver doesn't require any roles, nor does the approver need to be an administrator. When using this option, you have to select at least one approver (Microsoft recommends that you select at least two approvers). There are no default approvers.

Assignment duration. You can choose from two assignment duration options for each assignment type (eligible and active) when you configure settings for a role. These options become the default maximum duration when an administrator assigns the user to the role in PIM.

- You can choose one of these eligible assignment duration options:
- Allow permanent eligible assignment. Resource administrators can assign permanent eligible assignment.
- Expire eligible assignment after. Resource administrators can require that all eligible assignments have a specified start and end date.

You can choose one of these active assignment duration options:

Allow permanent active assignment. Resource administrators can assign permanent active assignment.

Expire active assignment after. Resource administrators can require that all active assignments have a specified start and end date.

Require multifactor authentication on active assignment. You can require that administrators provide multifactor authentication when they create an active (as opposed to eligible) assignment. PIM can't enforce MFA when the user uses their role assignment because they're already active in the role from the time the administrator assigned the role. PIM doesn't prompt an administrator for multifactor authentication if they authenticated with a strong credential or provided multifactor authentication earlier in their session.

Require justification on active assignment. You can require that users enter a business justification when they create an active (as opposed to eligible) assignment. In the Notifications tab on the role settings page, PIM enables granular control over who receives notifications and which notifications they receive.

Turning off an email. You can turn off specific emails by clearing the default recipient check box and deleting any other recipients.

Limit emails to specified email addresses. You can turn off emails sent to default recipients by clearing the default recipient check box. You can then add other email addresses as recipients. If you want to add more than one email address, separate them using a semicolon (;).

Send emails to both default recipients and more recipients. You can send emails to both default recipient and another recipient by selecting the default recipient checkbox and adding email addresses for other recipients.

Critical emails only. For each type of email, you can select the check box to receive critical emails only. What this means is that PIM sends emails to the specified recipients only when the email requires an immediate action. For example, PIM doesn't send emails asking users to extend their role assignment, but it sends emails requiring administrators to approve an extension request.

Assign roles to users

With Microsoft Entra ID, a Global Administrator can make permanent Microsoft Entra administrator role assignments. A Global Administrator can create these assignments using either the Microsoft Entra admin center or PowerShell commands. The PIM service also allows Privileged Role Administrators to make permanent administrator role assignments. Privileged Role Administrators can also make users eligible for Microsoft Entra administrator roles. An eligible administrator can activate the role when they need it. An activated role remains active through the duration of its assignment.

Privileged Identity Management supports both built-in and custom Microsoft Entra roles.

The assignment process starts by assigning roles to members. To grant access to a resource, the administrator assigns roles to users, groups, service principals, or managed identities. The assignment includes the following data:

- The members or owners to assign the role.
- The scope of the assignment. The scope limits the assigned role to a particular set of resources.
- The type of the assignment. There are two types of assignments:

Eligible. These assignments require the member of the role to perform an action to use the role. Actions can include:

- i. Performing a multifactor authentication (MFA) check
- ii. Providing a business justification
- iii. Requesting approval from designated approvers

Active. These assignments don't require the member to perform any action to use the role. Members assigned as active have the privileges assigned to the role.

The duration of the assignment. You can set the duration of an assignment to either:

Permanent. These assignments have no expiration date. Use this option for permanent workers who frequently need the role permissions.

Time-bound. These assignments expire at the end of a specified period. Use this option with temporary or contract workers. For example, workers whose project have a known end date and time.

For certain roles, administrators can use PIM to restrict the scope of the granted permissions to a single administrative unit, service principal, or application. This procedure is an example of assigning a role that has the scope of an administrative unit. For a list of roles that support scope through an administrative unit, see [Assign scoped roles to an administrative unit](#).

Additional reading. For more information, see [Assign Microsoft Entra roles](#), [Assign Azure resource roles](#), and [Assign eligibility for a PIM for Groups](#).

Activate role assignments

If a user is eligible for an administrative role, they must activate the role assignment when they need to perform privileged actions. For example, if you occasionally manage Microsoft 365 features, your organization's Privileged Role Administrators might not make you a permanent Global Administrator. Privileged Role Administrators are hesitant to assign a permanent Global Administrator role because it impacts too many other services. Instead, they would make you eligible for a specific service role, such as Exchange Online Administrator. You can request to activate that role when you need its privileges. Doing so provides you with administrator control for a predetermined time period.

If an administrator configured the role in PIM to require approval to activate, PIM sends an email notification to the approver. If the role doesn't require approval to activate, the assigned user can immediately start using the role.

Additional reading. For more information, see [Activate Microsoft Entra roles](#), [Activate my Azure resource roles](#) and [Activate my PIM for Groups roles](#).

Approve or deny requests

Delegated approvers receive email notifications when a role request is pending their approval. Approvers can view, approve, or deny these pending requests in PIM. After the approver approves the request, the member can start using the role. For example, if PIM assigns a user or group with the Contribution role to a resource group, they can then begin managing that particular resource group.

Additional reading. For more information, see Approve or deny requests for Microsoft Entra roles, Approve or deny requests for Azure resource roles, and Approve activation requests for PIM for Groups.

Extend and renew assignments

Administrators can assign roles with fixed durations using start and end date properties. When the assignment end approaches, Privileged Identity Management sends email notifications to the affected users or groups. It also sends email notifications to administrators of the resource to ensure they maintain appropriate access.

Note

The system can renew assignments and keep them visible for up to 30 days in an expired state, regardless of whether an administrator extended access.

Organizations can address the expiration of time-bound assignments in one of two ways:

Extend. When a role assignment nears expiration, the user can use PIM to request an extension for the role assignment.

Renew. When a role assignment expires, the user can use PIM to request a renewal for the role assignment.

Both user-initiated actions require an approval from a Global Administrator or Privileged Role Administrator. With PIM, organizations don't have to worry about their administrators constantly being on the lookout for assignments due to expire. Instead, administrators can just wait for the extension or renewal requests to arrive for simple approval or denial.

Only administrators of the resource can extend or renew role assignments. The affected user or group can request to extend roles that are about to expire and request to renew roles that are already expired.

Privileged Identity Management sends email notifications to administrators and affected user or groups of roles that are expiring within 14 days and one day prior to expiration. It sends another email when an assignment officially expires.

Administrators receive notifications when a user or group assigned an expiring or expired role requests to extend or renew. When a specific administrator resolves the request, the system notifies all other administrators of the resolution decision (approved or denied). It then notifies the requesting user or group of the decision.

When approving a request to extend role assignment, resource administrators can choose a new start date, end date, and assignment type. Changing assignment type can be necessary if the administrator wants to provide limited access to complete a specific task (one day, for

example). In this example, the administrator can change the assignment from Eligible to Active. This change means they can provide access to the requestor without requiring them to activate.

If a user assigned to a role doesn't request an extension for the role assignment, an administrator can extend an assignment on behalf of the user. Administrative extensions of role assignment don't require approval. However, the system sends notifications to all other administrators after a user or administrator extends the role.

Chapter 3: System Analysis

(MCA/MSc(DS) min 8 pages | BCA min 6 pages)

“The proposed PAM system is economically feasible as it can be developed using low-cost or open-source technologies, reducing implementation expenses. Additionally, it helps prevent financial losses caused by cyberattacks, data breaches, and misuse of privileged accounts, making it a cost-effective solution for organizations.”

This chapter includes:

1. Functional Requirements
2. Non-Functional Requirements
3. Feasibility Study

Refined Functional Requirements:

- “The system should allow users to authenticate using multi-factor authentication (MFA) to ensure secure login.”
- “The system should provide role-based access control to restrict user permissions based on their job roles.”
- “The system should enable monitoring and logging of user activities to track and audit privileged access.”

Refined Non-Functional Requirements:

- “The system should provide high performance and fast response time with efficient hardware and network support.”
- “The system should ensure strong security by operating in a secure network environment to prevent unauthorized access.”
- “The system should be user-friendly and easy to use, allowing administrators to efficiently monitor and trace user activities.”

What Is Privileged Identity Management?

Privileged Identity Management (PIM) is a feature of Microsoft Entra ID designed to help organizations enforce the principle of least privilege.

In simple terms, Privileged Identity Management ensures users receive elevated permissions only when they need them—and only for a limited time. This significantly reduces the risks associated with always-on administrative access.

Why Privileged Identity Management Matters

In today's digital workplace, privileged accounts are a primary target for attackers. Whether the threat is internal or external, unmanaged admin access can lead to:

- CloudStorage
 - Data breaches
 - Configuration drift
 - Compliance violations
 - Lateral movement across the tenant
 - Privileged Identity Management helps organizations control, monitor, and audit all privileged access in a centralized and secure way.
-

Key Features of Privileged Identity Management

- Just-in-Time (JIT) Access
Activate privileged roles only when required, reducing exposure windows.
- Time-Bound Role Assignments
Define start and end times for access—ideal for projects or temporary work.
- Approval-Based Role Activation
Require authorization before high-privilege roles are activated.
- Multi-Factor Authentication (MFA)
Enforce MFA during role activation to verify user identity.
- Access Reviews
Periodically review role assignments and remove unnecessary access.
- Detailed Audit Logs
Track all role activations and changes for compliance and investigation.

License Requirements for Privileged Identity Management

Microsoft Entra ID P1 vs. P2

Feature	Entra ID P1	Entra ID P2
Conditional Access	✓	✓
Multi-Factor Authentication	✓	✓
Identity Protection	✗	✓
Privileged Identity Management	✗	✓
Access Reviews	✗	✓
Just-in-Time Access	✗	✓

To use Privileged Identity Management, you need Microsoft Entra ID P2.

Pro tip: You do not need to assign the P2 license to every user in the tenant—only to administrators who will use or manage PIM.

Privileged Identity Management Best Practices

- Always require MFA for role activation
- Use Conditional Access policies for additional protection
- Prefer Eligible assignments over permanent roles
- Run regular access reviews
- Monitor audit logs for suspicious activity
- Align activation duration with actual task requirements
- ComputerSecurity

Benefits of Implementing Privileged Identity Management

- Improved Security Posture – Reduced risk of credential misuse
- Regulatory Compliance – Supports PCI-DSS, HIPAA, SOX, and more
- Operational Efficiency – Automated approvals and removals
- Consistent Governance – Centralized control of privileged access

What Are PIM Tools?

Privileged Identity Management (PIM) tools are designed to control, monitor, and audit elevated access to critical systems. They help organizations enforce the principle of least privilege, ensuring that administrators or privileged users only gain access when necessary.

Core Functions of PIM Tools

- Just-in-time access: Temporary elevation of privileges.
- Approval workflows: Require authorization before granting admin rights.
- Multi-factor authentication (MFA): Extra verification for sensitive roles.
- Access reviews: Regular checks to remove unnecessary privileges.
- Audit logs & alerts: Track and respond to suspicious activity.
- Compliance support: Meet standards like GDPR, HIPAA, PCI DSS, SOX.

Comparison of Leading PIM Tools

Feature	Azure PIM (Entra ID)	CyberArk	BeyondTrust	One Identity
Integration	Native with Azure, Microsoft 365, Intune	Broad multi- platform	Strong Unix/Linux support	Flexible across hybrid
Just-in-time Access	✓ Built-in	✓	✓	✓
Approval Workflow	✓ Customizable	✓	✓	✓
MFA Enforcement	✓ Native	Requires integration	Requires integration	✓
Audit & Reporting	✓ Detailed logs, exportable	✓ Advanced	✓	✓
Compliance	✓ Strong Microsoft compliance	✓	✓	✓
Ease of Use	✓ Seamless for Microsoft tenants	Moderate	Moderate	Moderate
Best For	Enterprises using Microsoft ecosystem	Large multi- platform orgs	Security- focused Linux/Unix	Hybrid IT environments

To deploy Azure Privileged Identity Management (PIM), the main system requirement is having a Microsoft Entra ID Premium P2 or Microsoft Entra ID Governance license. Beyond licensing, PIM is cloud- native, so you don't need heavy on- premises infrastructure—just proper Azure tenant configuration and supported admin roles.

Core System Requirements for Azure PIM

Licensing:

Microsoft Entra ID Premium P2 or
Microsoft Entra ID Governance license

These are mandatory to enable PIM features. docs.azure.cn

Azure Tenant:

A valid Microsoft Entra tenant (formerly Azure AD).

Global Administrator or Privileged Role Administrator rights to configure PIM.
docs.azure.cn

Supported Roles:

Microsoft Entra roles (directory roles like Global Admin, Security Admin, etc.).
Azure RBAC roles (subscription, resource group, resource level).
PIM for Groups (security groups, app provisioning groups). [Microsoft Learn](#)

Authentication Requirements:

Multi- Factor Authentication (MFA) must be enabled for role activation.
Conditional Access policies can be enforced for additional security. [Microsoft Learn](#)

Recommended Setup Steps

- Enable PIM in your tenant
 - Navigate to Microsoft Entra ID → Identity Governance → Privileged Identity Management.
 - Ensure licensing is active.
 - Configure Role Settings
 - Define eligible roles (who can request access).
 - Set approval workflows and MFA enforcement.
 - Assign Eligible Users/Groups
 - Users or groups can be assigned just- in- time access.
 - Group membership can trigger provisioning via SCIM protocol. [Microsoft Learn](#)
 - Audit & Compliance Setup
 - Enable notifications for role activation.
 - Configure access reviews and export audit logs for compliance.
-

Chapter 4: System Design

(MCA/MSc(DS) min 10 pages | BCA min 8 pages)

Out of curiosity, I asked the IT team why so many users needed Global Admin access. Their response was honest—and familiar:

BusinessProcess

“We assigned Global Admin access because certain tasks couldn’t be completed with the existing role. Once the work was done, we simply forgot to remove it.”

This scenario is far more common than most organizations realize. While it often starts with good intentions, permanent privileged access quickly becomes a serious security risk. Microsoft recommends keeping the number of Global Administrators to a minimum—ideally fewer than five—to reduce your attack surface.

Leaving standing privileged access in place increases the blast radius of an account compromise and often creates compliance gaps.

The good news? Strong security doesn’t have to slow down productivity.

That’s exactly where **Privileged Identity Management (PIM)** comes in.

What Is Privileged Identity Management?

Privileged Identity Management (PIM) is a feature of Microsoft Entra ID designed to help organizations enforce the principle of least privilege.

In simple terms, Privileged Identity Management ensures users receive elevated permissions only when they need them—and only for a limited time. This significantly reduces the risks associated with always-on administrative access.

Why Privileged Identity Management Matters

In today’s digital workplace, privileged accounts are a primary target for attackers. Whether the threat is internal or external, unmanaged admin access can lead to:

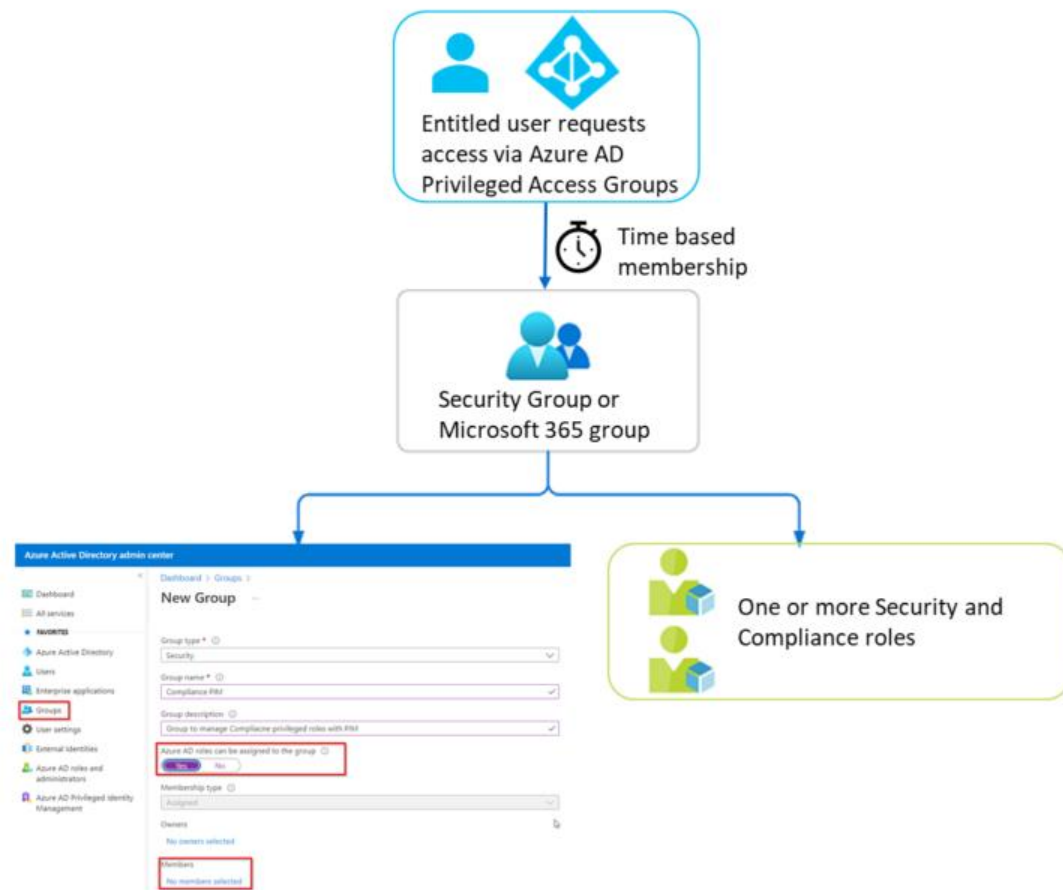

- CloudStorage
- Data breaches
- Configuration drift

- Compliance violations
- Lateral movement across the tenant
- Privileged Identity Management helps organizations control, monitor, and audit all privileged access in a centralized and secure way.

Key Features of Privileged Identity Management

- **Just-in-Time (JIT) Access**

Activate privileged roles only when required, reducing exposure windows.

License Requirements for Privileged Identity Management

Microsoft Entra ID P1 vs. P2

Feature	Entra ID P1	Entra ID P2
Conditional Access	✓	✓
Multi-Factor Authentication	✓	✓
Identity Protection	✗	✓
Privileged Identity Management	✗	✓
Access Reviews	✗	✓
Just-in-Time Access	✗	✓

To use Privileged Identity Management, you need Microsoft Entra ID P2.

Pro tip: You do not need to assign the P2 license to every user in the tenant—only to administrators who will use or manage PIM.

Privileged Identity Management Best Practices

- Always require MFA for role activation
- Use Conditional Access policies for additional protection
- Prefer Eligible assignments over permanent roles
- Run regular access reviews

- Monitor audit logs for suspicious activity
 - Align activation duration with actual task requirements
 - ComputerSecurity
-

Benefits of Implementing Privileged Identity Management

- Improved Security Posture – Reduced risk of credential misuse
 - Regulatory Compliance – Supports PCI-DSS, HIPAA, SOX, and more
 - Operational Efficiency – Automated approvals and removals
 - Consistent Governance – Centralized control of privileged access
-

Chapter 5: System Implementation (MCA/MSc(DS) min 12 pages | BCA min 8 pages)

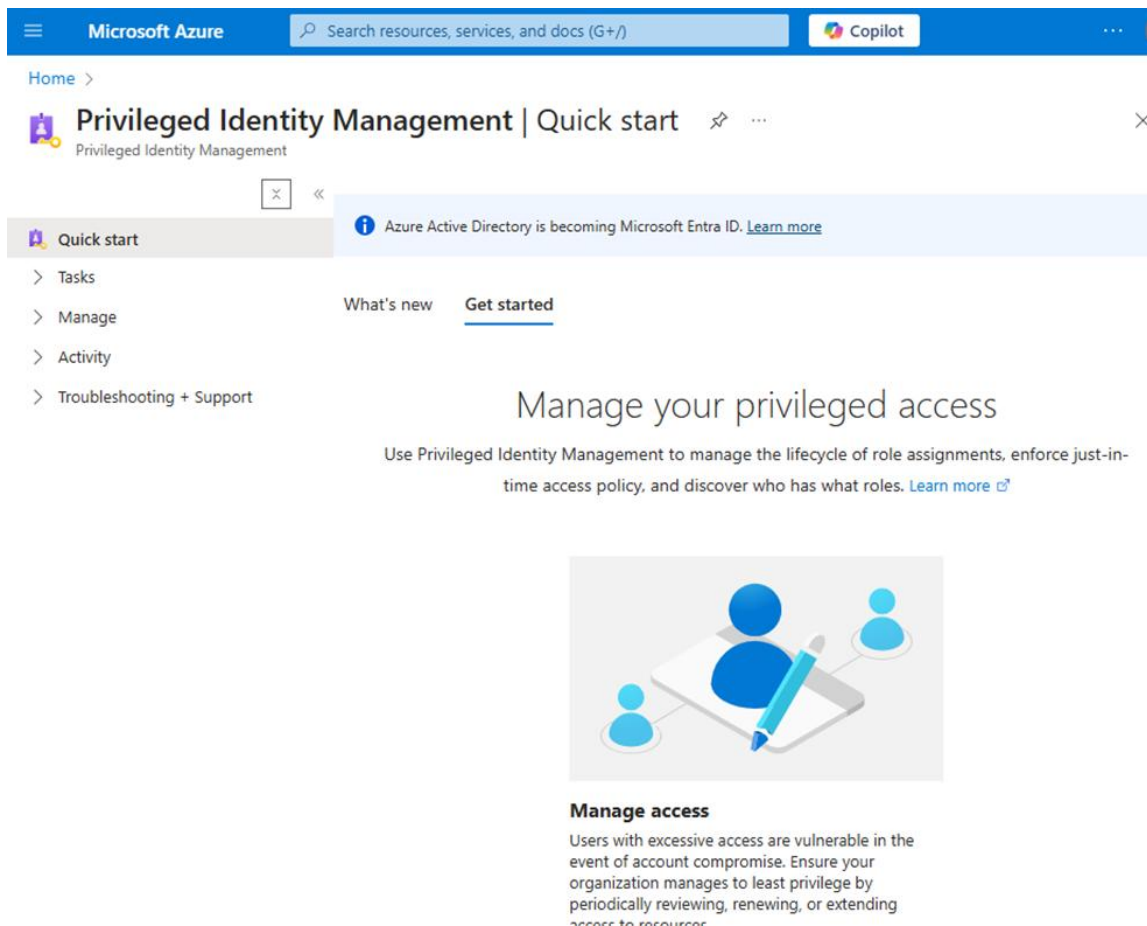

Step-by-Step: Configure Privileged Identity Management

Step 1: Enable PIM

Sign in to the [Azure portal](#) or the [Entra ID Portal](#).

Update

Prev: Assignment

For lower-privilege roles (Helpdesk, User Administrator, Exchange Admin):

Set eligibility for up to 8 hours

Require justification only

For high-privilege roles (Global Admin, SharePoint Admin):

ContentManagement

Require justification and approval

Limit activation duration

Assign approvers using a dedicated security or M365 group.

Using Entra ID *security or M365 dynamic groups* for admins and approvers makes PIM far easier to manage at scale.

How Eligible Assignments Work

For lower-privileged roles such as Helpdesk Administrator, User Administrator, or Exchange Administrator, you can assign users as Eligible with a maximum activation duration of up to 8 hours. These roles can typically be activated using justification only, without approval.

CloudStorage

For high-privileged roles such as Global Administrator or SharePoint Administrator, you should configure activation to require approval. This ensures an additional security checkpoint before elevated access is granted.

In this guide, we will review the experience from:

The requester's perspective (admin requesting access)

The approver's perspective (approving or denying access)

Best Practice: Use Groups for Role Management

For better governance and scalability, create Entra ID Security Groups or Dynamic Groups.

In this tenant, two groups were created:

BusinessProcess

One group for admins eligible for privileged roles

Another group for PIM approvers and access reviewers

Add a group Export search results Refresh 2 items

Name	Email	Type	Sync status	Teams status	Membership type	Privacy	Created on	Choose columns
☐ PIM Eligible	...	Security	○		Assigned	Private	January 10, 2026 at 7:45 PM	
☐ PIM Reviewer & Approver	...	Security	○		Assigned	Private	January 9, 2026 at 11:46 AM	

This approach simplifies role management and approval workflows.

Example Scenario

In this example:

Users are eligible for Exchange Administrator, Privileged Role Administrator, and SharePoint Administrator roles with justification only.

The Global Administrator role requires approval before activation.

ContentManagement

Select the Global Administrator role (or any high-privilege role you want to restrict) and configure it accordingly.

Configure Activation Settings

Under Activation settings, click the Edit (pencil) icon.

Role setting details - Global Administrator ...

Privileged Identity Management | Microsoft Entra roles

Add the Approver Admins group and save the changes.

BusinessProcess

Under the Activation tab, you can also configure eligibility expiration and other related settings. Default values are sufficient for most environments, but you can adjust them to meet your requirements.

Notifications Configuration

By enabling notifications for role activations, you can track when privileged roles are activated. See the above Notifications management.

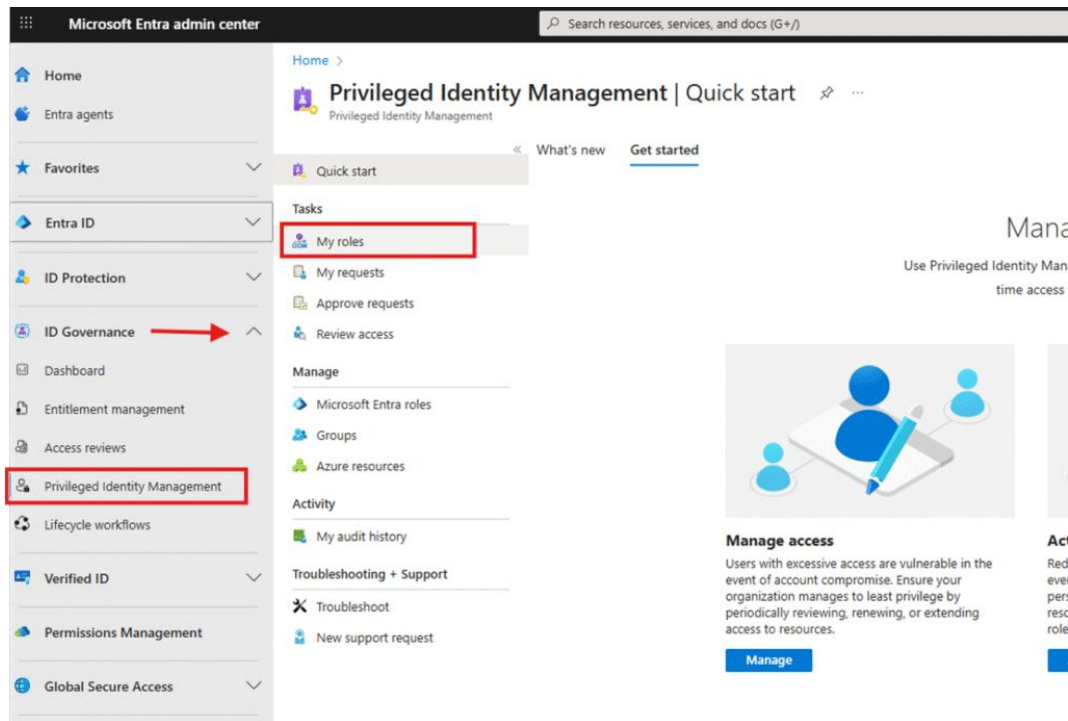

Best practice: Use Microsoft 365 groups for PIM approvers and eligible admins to simplify notification management.

How Admins Check Eligibility and Activate PIM Roles

Sign in to entra.microsoft.com.

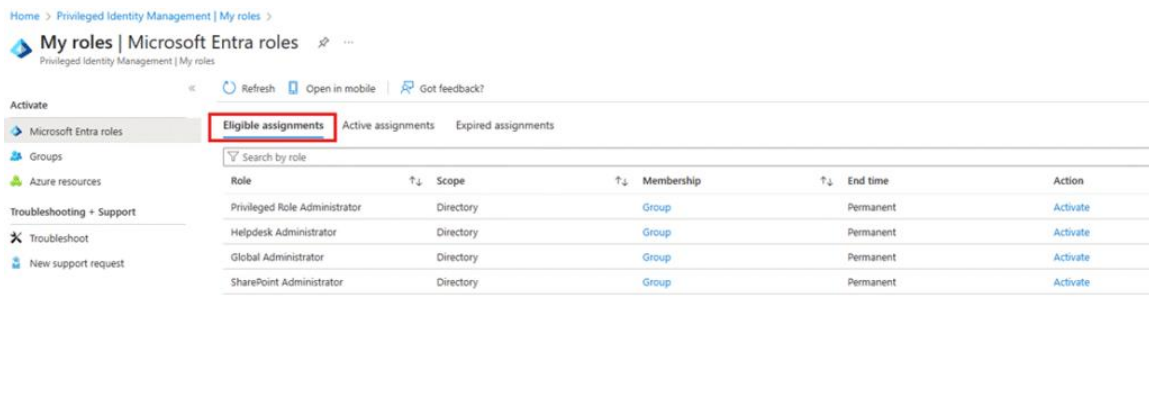

Navigate to Privileged Identity Management under the ID Governance menu.

Click My roles.

Under Eligible assignments, you will see the roles available for activation.

Business& Productivity Software

Activating a Role Without Approval

Select Helpdesk Administrator.

Click Activate on the right side.

Eligible assignments Active assignments Expired assignments

At end of review, send notification to [+ Select User\(s\) or Group\(s\)](#)

Access reviews ensure privileged access remains aligned with business needs.

Chapter 7: Results & Discussion

(MCA/MSc(DS) min 4 pages| BCA min 3 pages)

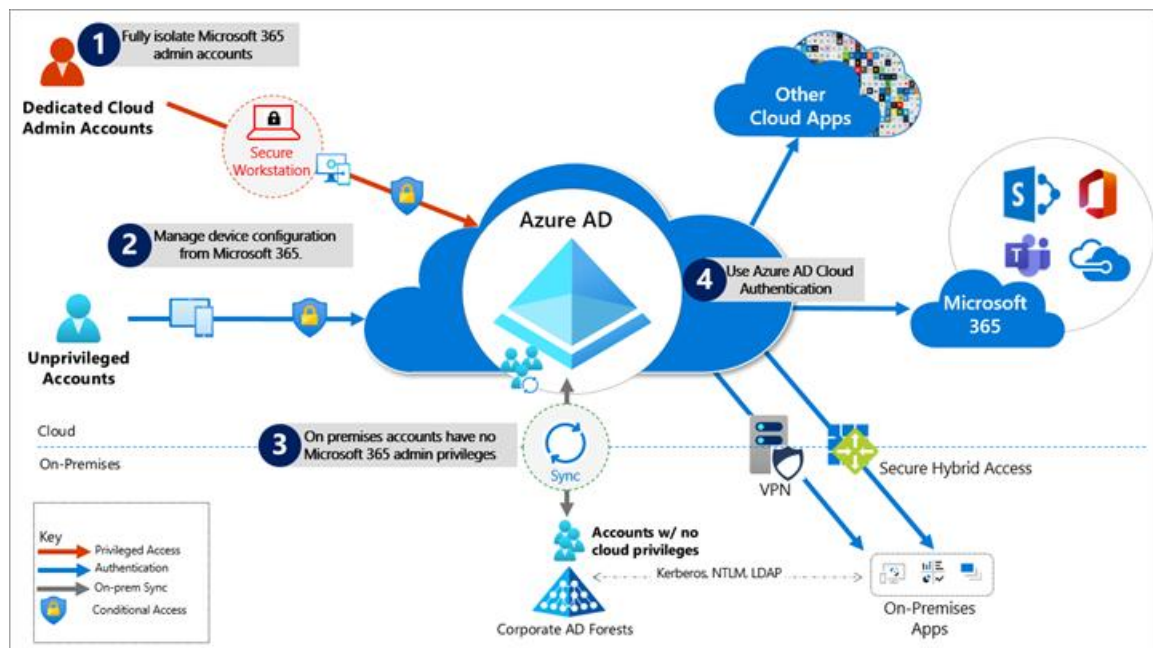

Results of Applying Azure PIM for Privileged Access Management

Summary

Objective:

To secure privileged accounts by eliminating permanent admin rights, enforcing just-in-time access, and ensuring compliance through Azure PIM.

- Key Achievements After Implementation:
- Reduced risk of credential theft and insider misuse.
- Established Zero Standing Privilege (ZSP) across all admin roles.
- Improved compliance posture with GDPR, HIPAA, SOX, and ISO standards.
- Streamlined audit and reporting for external and internal reviews.
- Increased operational efficiency by automating access workflows.

Security Enhancements

1. Just-in-Time Access

Privileged roles are activated only when needed, reducing exposure.

Time-bound sessions automatically expire, preventing lingering access.

2. Multi-Factor Authentication (MFA)

Enforced for every privileged role activation.

Adds an extra layer of defense against phishing and credential theft.

3. Approval Workflows

High-risk roles (Global Admin, Security Admin) require secondary approval.

Prevents unauthorized or accidental privilege escalation.

4. Conditional Access Policies

Restricts activation to compliant devices, trusted networks, or specific geographies.

Ensures privileged access is context-aware and secure.

PIM: Review Help Desk's request to activate the Global Administrator role

Role name	Global Administrator
Reason	Need to Add new Domain in Our Account, As Discussed during the Call
Start Time	2026-01-12 06:29:32Z

Privileged Identity Management protects your organization from accidental or malicious activity by reducing persistent access to Azure resources, providing just-in-time or time-limited access when needed.

Governance & Compliance Outcomes

Audit & Monitoring:

- Every activation logged in Azure Monitor / Log Analytics.
- Alerts sent to SOC teams when privileged roles are activated.
- Integration with Microsoft Sentinel for advanced threat detection.
- Access Reviews:
- Regular reviews ensure only necessary users remain eligible.
- Automated reminders reduce administrative overhead.
- Compliance Benefits:
- Simplified evidence collection for audits.
- Demonstrated adherence to least-privilege principles.
- Faster response to regulatory inquiries.

Users | Sign-in logs

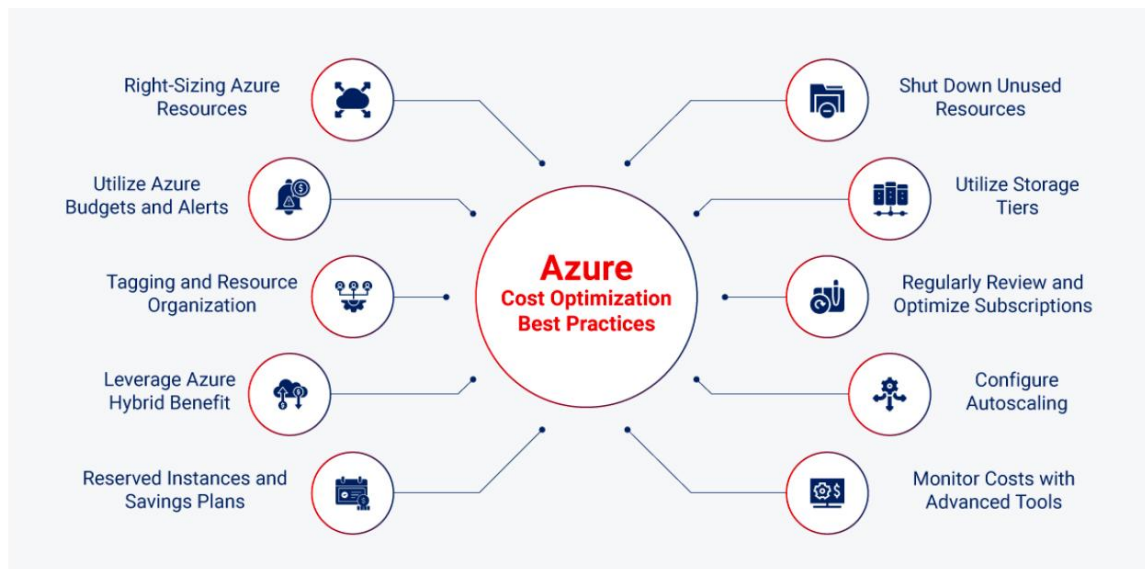

TeamSquat

Business Impact & ROI

- Operational Efficiency:
 - Reduced manual tracking of privileged accounts.
 - Automated workflows save admin time and reduce errors.
- Risk Reduction:
 - Eliminated permanent admin accounts.
 - Minimized insider threat and external attack vectors.

Cost & Value:

- Licensing investment offset by reduced breach risk and audit costs.
- Lowered insurance premiums in some industries due to stronger controls.
- Strategic Advantage:
 - Strengthened trust with customers and partners.
 - Positioned IT as a proactive enabler of secure digital transformation.

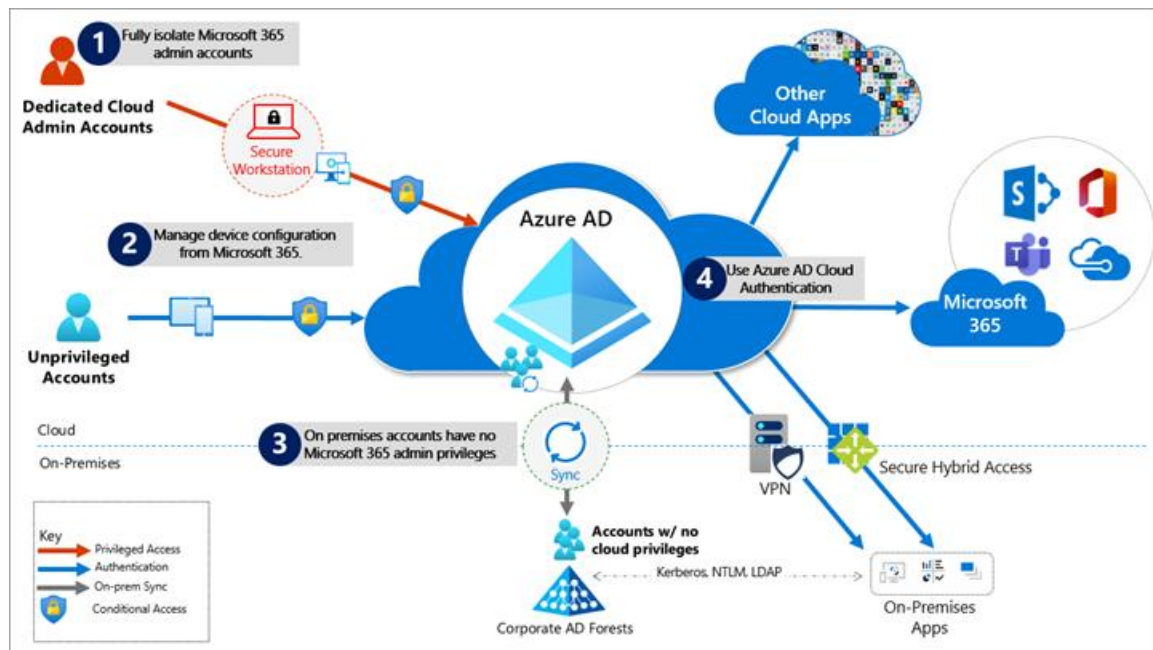

Chapter 8: Conclusion & Future Scope

(MCA/MSc(DS) min 3 pages | BCA min 2 pages)

Conclusion

“The Privileged Access Management (PAM) system plays a vital role in securing organizational resources by controlling and monitoring privileged accounts. This project provided a clear understanding of how secure authentication, role-based access control, and activity monitoring can significantly reduce security risks. The implementation using Azure Privileged Identity Management demonstrated real-world application of PAM concepts, ensuring better control, visibility, and protection of sensitive data and user identities.”

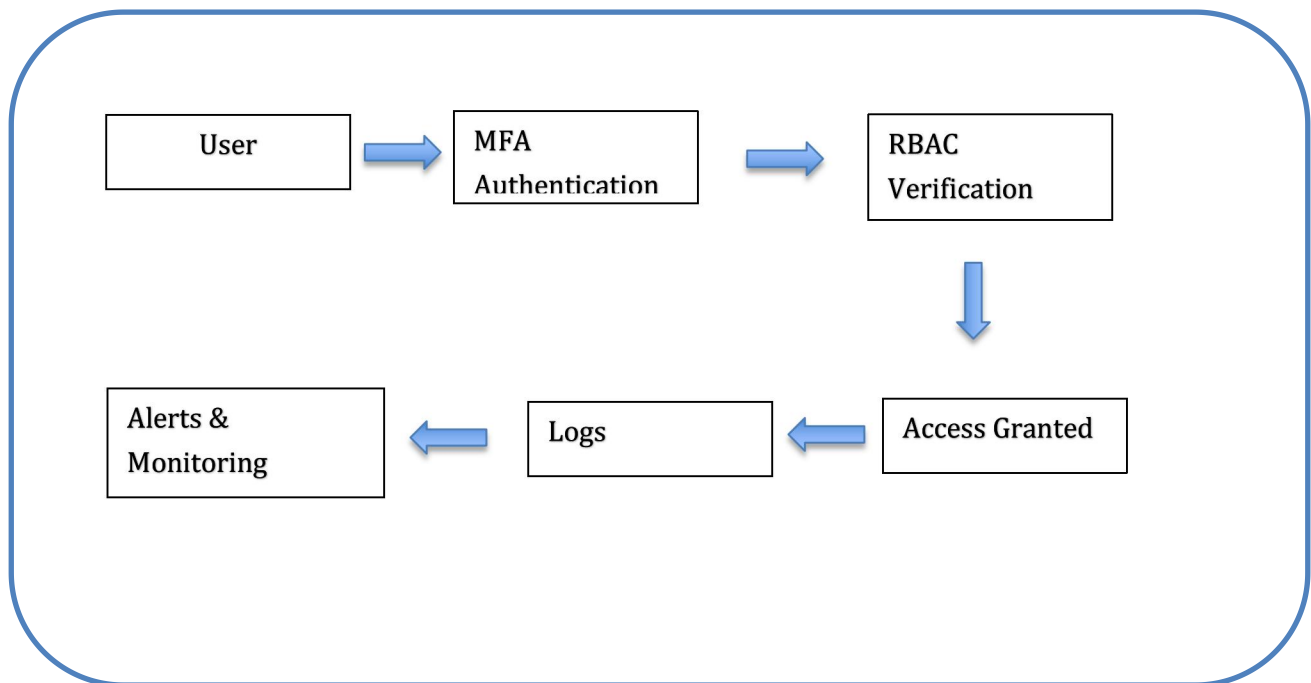

Key Outcomes of the Project

- Secure management of privileged accounts
- Implementation using Azure Privileged Identity Management
- Real-world understanding of identity security
- Improved monitoring and control over user activities

Core Features Implemented

- Multi-Factor Authentication (MFA) → Strong login security
 - Role-Based Access Control (RBAC) → Access based on job roles
 - Just-In-Time (JIT) Access → Temporary privileged access
 - Audit Logs → Track user activities
 - Alerts → Detect suspicious actions
-

System Workflow

Benefits of Azure PIM

- Reduces risk of data breaches
 - Eliminates permanent admin access
 - Improves accountability
 - Ensures compliance with security policies
 - Centralized control via Microsoft Entra ID
-

Learning Outcome

- I. Practical exposure to cloud security tools
 - II. Understanding of PAM concepts in real scenarios
 - III. Knowledge of identity and access management systems
-

Future Scope

“In the future, the PAM system can be enhanced by integrating advanced automation and cloud-based solutions. For example, automated user provisioning can be implemented, where new users are automatically assigned roles and access based on their job profiles. Similarly, access can be revoked automatically when a user leaves the organization. Integration with cloud platforms like Microsoft Azure allows centralized management of both cloud and on-premise systems. Additionally, the system can be improved by incorporating AI-based monitoring, biometric authentication, and advanced threat detection mechanisms for enhanced security.”
